Building a Complete Virtual Data Room Fast

Whether you are handling merger & acquisition (M&A) due diligence, managing a venture capital or private equity deal, refinancing, fundraising or conducting any other kind of complex corporate transaction, you will want to make sure the process is fast, secure, cost effective and stress-free. A Virtual Data Room (VDR) is set-up as part of the central data repository for such transactions. However, in many organizations, a lot of the data is unstructured, decentralized and largely unmanaged. Manually collecting and organizing the relevant documents to include in the VDR is labor intensive, time consuming and it is almost impossible to identify missing documents.

DATA SHEET Building a Complete Virtual Data Room Fast

Automate Due Diligence Tasks

ZyLAB uses Artificial Intelligence to automate due diligence tasks to guarantee the highest level of completeness, efficiency and quality. You can automatically collect relevant documents from their original location (email boxes, file shares, MS-SharePoint, O365), shift and filter agreements from non-agreements and automatically analyze and classify the content of specific contractual documents to get immediate insight in your contractual obligations, risks and opportunities.

ZyLAB technology originates from the highly demanding fields of eDiscovery and litigation. Whether you have to collect, organize and review documents for a VDR, or have to deal with the underlying documentation or maintenance records related to collateral for real-estate, life science, pharmaceutical, complex machinery, large infrastructures or portfolio management: ZyLAB technology helps you to prepare yourself faster, better and more cost effectively than with any other product on the market.

Benefits

- Quickly organize documents in the required structure for your VDR. Use the different tagging options to easily organize and rename documents. Detect missing documentation early to complete the VDR.
- Analyze the content as part of a vendor due diligence before you upload contracts into the VDR and identify deal risks and potential red flags so you can deal with these threats in advance.
- (Auto)-redact personal data (PII) and health information (PHI) before you disclose data to third parties and comply with the upcoming General Data Protection Act (GDPA).
- Protect intellectual property, confidential information or privacy sensitive information by (auto) redaction and the use of pseudonyms, but keep the flexibility to disclose information in other phases of the M&A process.
- Produce information in industry-standard formats to the leading VDR providers.
- Store your VDR in a fully analyzed and searchable format for later reference.
- Efficiently answer additional requests from regulators when seeking permission to merge.
- Implement pro-active FCPA investigations by directly investigating relevant data.
- Escrow the VDR for future search after closing a deal.
